

Goal: be as simple as pico8 art style and functions
But be able to create full games with 16x9 resolution

Create example for each function

Purpose: qa test for all possibilities and also for documentation

Don't load files directly. Always. Look at main.mega8 file (create folder with all files, zip without compression and rename to .mega8)

If drag and drop zip into monogame window, reload everything. cross platform zip file (windows/linux). Not winrar.

Focus on running pico8 logic first.

Only after, think on game engine and shaders

320x180. Use 8x8 tiles

Sprite data > use 0-9 a-z for 33 colors (32 + transparent)

Add mega-8 intro in c#

Improve font

Don't add metadata

Add dirty flag, only convert sprite grid to image when flag is true for each frame and then, set flag to false again

Change sprt and map functions to handle multiple spritesheets and maps

Add save/load using unique a-z name id .mstate8 (outside zip)

Add sspr(sx, sy, sw, sh, dx, dy, [dw], [dh], [flip_x], [flip_y])

Instead of draw circle, ssprt circle with scale

Example: Create white circle in sprite and then scale and use color

Maybe list:

Create a reusable function for animation and particles that can work for any scenario?

Anim: dictionary<string,anim>

Anim obj.

- Each anim. List of sprites in order changing on time. N times
- Each sprite, filled or not filled spr or rect or circ function
- Add speed, loop, pause, resume, stop and play (with offset)

Particles: dictionary<string,particles>

Particles obj.

- List of particles
- Function, add, delete all,
- Speed, x and y position, x and y speed, rand,... look at pico8 example to make very generic
